

Grade 3 Math Unit 8- Geometry

UNIT OVERVIEW

In Grade 3, instructional time should focus on four critical areas. This unit addresses Critical Focus **Area #3, Developing understanding of the structure of rectangular arrays and of area, and #4, Describing and analyzing two-dimensional shapes.** (See Connections for explanation)

This unit address work from 1 cluster, Reason with shapes and their attributes. *(See Connections for explanation)

STANDARDS

CC_Common Core State Standards - Mathematics (2010) - Grade 3

Domain 3.G Geometry

Cluster Statement Reason with shapes and their attributes.

Standard 3.G.1 Understand that shapes in different categories (e.g., rhombuses, rectangles, and others) may share attributes (e.g., having four sides), and that the shared attributes can define a larger category (e.g., quadrilaterals). Recognize rhombuses, rectangles, and squares as examples of quadrilaterals, and draw examples of quadrilaterals that do not belong to any of these subcategories.

Standard 3.G.2 Partition shapes into parts with equal areas. Express the area of each part as a unit fraction of the whole.

CONTENT ELABORATIONS

In Grade 2, students identify and draw triangles, quadrilaterals, pentagons and hexagons. Third graders build on this experience and further investigate quadrilaterals (technology may be used during this exploration)

3.G.1 Students recognize shapes that are and not quadrilaterals by examining properties of the geometric figures. They conceptualize that a quadrilateral must be a closed figure with four straight sides and begin to notice characteristics of the angles and the relationship between opposite sides. Students should be encouraged to provide details and use proper vocabulary when describing the properties of quadrilaterals. They sort geometric figures and identify squares, rectangles and rhombuses and quadrilaterals. Students should classify shapes by attributes and draw shapes that fit specific categories. For examples, parallelograms include: squares, rectangles, rhombi, or other shapes that have two pairs of parallel sides. Also, the broad category quadrilaterals include all types of parallelograms, trapezoids, and other four-sided figures.
MP.2, MP.3, MP.5, MP.6 should be emphasized.

3.G.2 **3.G.2** builds on students' work with fractions and area. Students are responsible for partitioning shapes into halves, thirds, fourths, sixths and eights. Given a shape, students partition it into equal parts, recognizing that these parts all have the same area. they identify the fractional name of each part and are able to partition a shape into parts with equal areas in several different ways.
MP.2, MP.4, MP.5 should be emphasized.

UNIT VOCABULARY

angle
vertex
right angle
ray
endpoint
polygon
pentagon

hexagon
octagon
triangle
attribute
quadrilateral
right triangle

parallelogram
parallel
square
rectangle
rhombus
trapezoid

BIG IDEAS

ENDURING UNDERSTANDINGS

- Identify and describe properties of two-dimensional shapes using properties that are shared between the shapes.
- Generalize that shapes fit into a particular classification.
- Compare and classify shapes by their sides and angles, and connect these with definitions of shapes.
- Geometric figures can be classified according to their properties.
- Quadrilaterals can be classified according to the lengths of their sides.
- Recognize shapes that are and are not quadrilaterals by examining the properties of the geometric figures.
- Conceptualize that a quadrilateral must be a closed figure with four straight sides and begin to notice characteristics of the angles and the relationship between opposite sides
- Provided details and use proper vocabulary when describing the properties of quadrilaterals.
- Sort geometric figures and identify squares, rectangles, and rhombuses as quadrilaterals.
- Classify shapes by attributes and by drawing shapes that fit specific categories. (e.g.; parallelograms include: squares, rectangles, rhombi, or other shapes that have two pairs of parallel sides.
- The broad category "Quadrilaterals" includes all types of parallelograms, trapezoids and other four-sided figures.
- Relate fraction work to geometry by expressing the area of a shape as a unit fraction of the whole.

ESSENTIALS QUESTIONS

Choose a few questions based on the needs of your students

- Can all shapes be split into halves, thirds, fourths, sixths and eighths? Prove it.
- Describe what a fraction looks like in a shape?
- Do quadrilaterals have to look like rectangles? How do you know?
- Do rectangles and squares always look the same? How do you know?
- Do you think shapes could be grouped together in the same family or classification? Explain.
- Does a _____ (include any shape) always look the same?
- Does the direction that a shape is facing change the way it looks? Does it change the shape's name?
- How are quadrilaterals alike and different? • How are the perimeter and area of a shape related? • How are the quadrilaterals alike?
- How can common shapes be used to create pictures?
- How can I use attributes to compare and contrast shapes?
- How can rectangles have the same perimeter but have different areas?
- How can we use two- dimensional shapes to solve problems?
- How can you create different types of quadrilaterals?
- How can you show what you have learned about quadrilaterals and other shapes?
- How do attributes help us describe shapes?

CONNECTIONS

In Critical Focus Area #3, students recognize area as an attribute of two-dimensional regions. They measure the area of a shape by finding the total number of same-size units of area required to cover the shape without gaps or overlaps, a square with sides of unit length being the standard unit for measuring area. Students understand that rectangular arrays can be decomposed into identical rows or into identical columns. By decomposing rectangles into rectangular arrays of squares, students connect area to multiplication, and justify using multiplication to determine the area of a rectangle.

In Critical Focus Area #4, students describe, analyze, and compare properties of two-dimensional shapes. They compare and classify shapes by their sides and angles, and connect these with definitions of shapes. Students also relate their fraction work to geometry by expressing the area of part of a shape as a unit fraction of the whole.

* This cluster is connected to Reason with shapes and their attributes **(2.G.3)**

Standards for Mathematical Practice (SMP)

MP.1 Make sense of problems and persevere in solving them

MP.2 Reason abstractly and quantitatively

MP.3 Construct viable arguments and critique the reasoning of others

MP.4 Model with mathematics

MP.5 Use appropriate tools strategically

MP.6 Attend to precision

MP.7 Look for and make use of structure (Deductive reasoning)

MP.8 Look for and express regularity in repeated reasoning (Inductive Reasoning)

REASON WITH SHAPES AND THEIR ATTRIBUTES

CONTENT		SKILLS
A.	Understand that shapes in different categories may share attributes, and that the shared attributes can define a larger category.	Understand that shapes in different categories may share attributes, and that the shared attributes can define a larger category. 1. Identify and define rhombuses, rectangles, and squares as examples of quadrilaterals based on their attributes. 2. Describe, analyze, and compare properties of two-dimensional shapes. 3. Compare and classify shapes by attributes, sides and angles. 4. Group shapes with shared attributes to define a larger category (e.g., quadrilaterals) 5. Draw examples of quadrilaterals that do and do not belong to any of the subcategories.
	Partition shapes into parts with equal areas.	Partition shapes into parts with equal areas. 1. Know that shapes can be partitioned into equal areas. 2. Describe the area of each part as a fractional part of the whole. 3. Describe the area of each part as a fractional part of the whole.
